

ABSTRACT

Drilling method for creating a channel leading from surrounding soil into a shaft which is separated from the soil by a wall, said method comprising the following steps:

- drilling a channel through the soil from a starting pit in the direction of the shaft using a first drill head,
- drilling through the wall in this direction with the first drill head in order to create a breach in the wall,
- changing from the first drill head to a second drill head in the shaft,
- widening the breach in the wall by drilling in the opposite direction with the second drill head.
